

SCALING AI IN AUSTRALIA AND NEW ZEALAND WITH ML FOUNDATIONS AND DATABRICKS

Ronald Wu, Senior Data Scientist, Mantel Group Josh Faure, Solution Architect, Databricks 13 June 2024

DATATAI SUMMIT

Introducing Today's Speakers

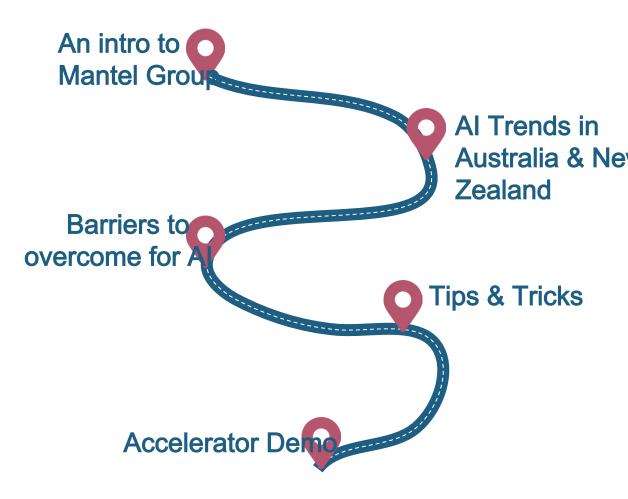

Ronald Wu Data Scientist @ Mantel Group

Josh Faure Solutions Architect @ Databricks

The journey we'll go on together...

Changing how the world works for the better.

An Introduction to Mantel Group

Our capability & experience

Mantel Group is the leading independent team partnering with you to create solutions and deliver outcomes that make your business better.

= Digital

- → Digital strategy and roadmap advisory
- → End-to-end digital project delivery
- → Product, design and development

Cloud

- → Deep capability across Azure, AWS and Google Cloud
- → Cloud strategy, adoption, migration and implementation
- → Cloud and application modernisation and optimisation

Data + AI / ML

- → Machine Learning capability to design, build & enable AI
- → Deep expertise across Databricks & Snowflake
- → Data strategy & transformation design and implementation

1

Cybersecurity

- → Cohesive, integrated cybersecurity capabilities
- → Enable large-scale cyber security initiatives
- → Improve the protection of IT environments

We know Databricks

Specifically, we are experts in deploying and building solutions on Databricks.

Mantel Group has demonstrated experience designing and building Databricks solutions

These are large, complex programs of work where our experience and expertise have enabled successful outcomes.

Only company in Australia with a dedicated Databricks practice, with Elite level partner status

There are 3 criteria: 1. Consumption (\$DBUs); 2. Enablement (Technical Consultants) and 3. Sourced Booking.

We have over 70 Databricks certified team members

Giving us deep specialisation, and a highly trained and certified workforce. Additionally, we're a **Delivery Partner for Databricks**. We're the company that Databricks trusts to deliver their own professional services work and enables us to leverage their partner services funding program (DCIF)

An award winning Databricks Regional System Integration Partner for 2023

Al Trends in Australia & New Zealand

Industry approach to Al is evolving!

Industry approach to Al is evolving!

Organisations are increasingly embracing the true business benefits of Machine Learning

Some of the key trends happening right now \square <u>-@</u>: More projects Unlocked use Operational **Democratisation Data quality &** efficiency engineering cases Advancements in The Gen Al revolution Enterprises are AI/ML is a requirement Significant challenges Natural Language investing more than of all organisations & exist with collecting, has sparked a substantial amount of Processing (NLP) and ever into internal cross-discipline teams. cleaning, and Gen Al have unlocked a productivity and This has been a big transforming the huge Al funding across businesses, leading to broad spectrum of new efficiency focus of enterprises in amount of data being more projects than use cases especially in improvements, the last few years and generated within ever before. These the domain of encompassing use we're seeing the current businesses. AI/ML synthesis and logical cases like workflow pace slow but wouldn't requires solid data projects includes not only Proof of Concepts reasoning. The topautomation (i.e. be surprised to see this foundations within an (PoCs) but increasingly down executive generative & synthesis) shift as the huge organisation and the Scaling Al and attention is also but also next-best demand for AI latest innovations action and decision enhancing MLOps. benefiting 'Classic' ML surpasses the capacity require more data than of internal DS/ML teams ever before. as use cases det support engines (i.e qualified. logical reasoning)

The majority of ANZ organisations are struggling to scale AI

'Al' in Business **Maturity Model** Where we see the majority of organisations get stuck in their Al journey. Scalable Number of Al models Reliable actively in production and Repeatable creating value Experimentation

Al Maturity across People, Processes & Technology

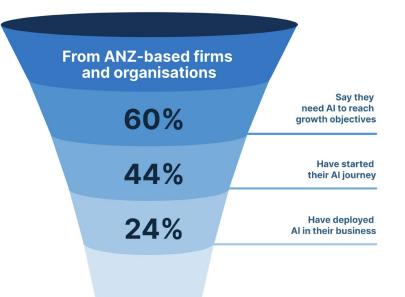

Changing how the world works for the better.

Creating an AI model is the 'easy' part of scaling AI...

The true challenge lies in building an ecosystem for enabling AI across the business that is maintainable today and can meet the demands of tomorrow.

Some fundamental changes are already occurring, <u>27% of organisations have</u> changed their operating model for AI.

What are the key barriers to overcome?

Main barriers to gaining traction and realising value with AI in organisations

1

Lack of scalable infrastructure

Inadequate computing, storage, and orchestration foundations for scaling AI. Duplicated & manual overhead across use cases development & productionisation.

- →Siloed AI PoC dev teams competing for shared resources, wait times...
- →Central DS/ML teams getting overloaded by manual support requests to set things up.
 →Lack of deployment patterns

Difficulty in integrating with processes & systems

Scattered data sources & disparate IT systems. Non-comprehensive understanding of underlying business requirements & processes.

- →Lack of early communication and mutual understanding
- →Data Scientists getting blocked by layers of data visibility and access permission hurdles
- →Layers and layers of the same data. What is the correct source? How should this feature be derived.

Lack of widespread understanding of AI tech

Business stakeholders possess knowledge gaps & difficulty in perceiving its usage. Over-reliance on knowledgeable technical owners.

- →Non-technical users under- or overestimate AI capabilities, the development process, or the risks involved, resulting in misuse and loss of trust
- \rightarrow Model performance changes over time
- →Al usage is limited to only high-technical people
- →Lack of democratisation of Al innovations among technical teams

Changing how the world works for the better.

Main barriers to gaining traction and realising value with AI in organisations

4

Data & model perfection paralysis

Limitations of data, dealing with imperfect models, lacking tools, model transparency, and risk management.

- →Data ingestion, cleansing, monitoring, and validation of minimal required data
- →Choose the most suitable algorithms based on what you need your model to do and not their popularity
- →Maintain and iterate on models

5

Governance getting introduced too late!

Stakeholder engagement & feedback loop lags, data management policies, explainability, and long term sustainability.

- →Evaluate every aspect of the solution for potential ethical issues.
- →Involve security / IT teams in design phase
- →Consult data governance for their considerations

Tips to avoid the pitfalls

Battle-Tested Principles and Frameworks

What are the core requirements for successful AI ?

These core pillars must exist for the continued success of your initiative.

People

Knowledge and understanding of **best practice** processes and responsibilities of Al.

- → Drive use cases
- → Define meaningful success metrics
- → Advocates for AI
- → Tooling decisions
- → Recruitment Strategy
- → Foster data literate cultures & accessibility
- → Democratise knowledge and information across teams

Process

Path forward to maintain high quality ML outputs and **consistent**, **repeatable** ML capabilities. This will enable rapid timetovalue and freedom for experimentation.

- → Unified processes
- → MLOps x DevSecOps
- → Ethical Responsibility & AI Practices
- → Project management
- → Be more Agile!
- → Risk & Compliance
- → Model & framework criteria
- → Prioritise explainability and interpretability

Technology

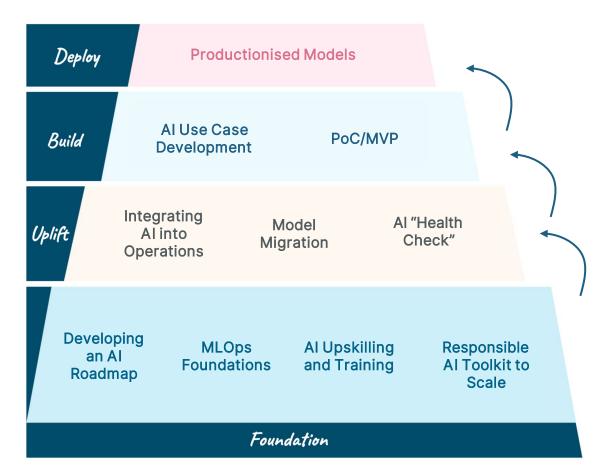

Reliable and **repeatable** artefacts of code and pipelines for end-to-end ML Operations that unifies DevOps and Machine Learning.

- → Solid Al Foundations
- → Feature Engineering
- → Build & deployment tech
- → Monitoring model performance
- → Embrace automation
- → Develop accelerators & reusable IP
- → Future-Ready

Starting with a solid AI Foundation is paramount

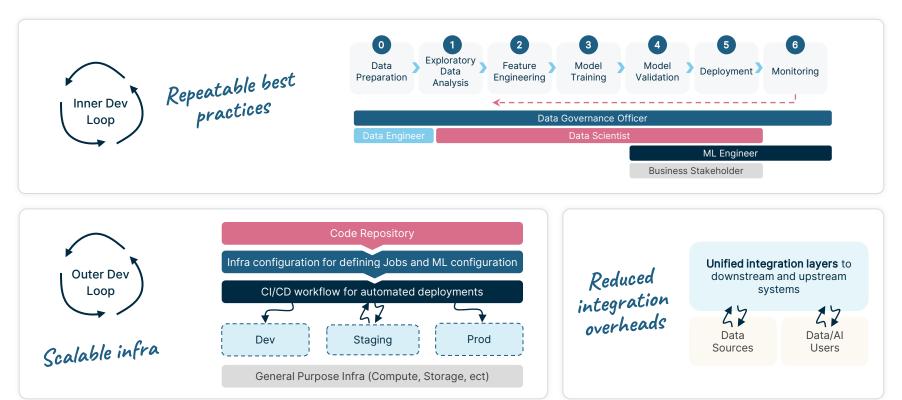

An organisation-wide uplift of AI capabilities and literacy across People, Processes, and Technology pillars

Standardise the AI development life cycle

To unify your end-to-end workflows and infrastructure

Technical Demo

MLOps Accelerator: from Infrastructure to Production-Ready Models on Databricks

A Walkthrough MLOps Demonstration Set up your first Databricks MLOps Platform on Day 1

The Ask

Company A has identified a few business problems that can be solved by AI/ML. They want to leverage **reusable artefacts**, without reinventing the wheel each time.

What Company A has gone through Identify a ML use case to start with

→ a taxi fare prediction use case, as it is needed by many business teams.

Chosen an operating model

→ a Central Team will own and develop a core MLOps repo to serve multiple business teams.

Prepared basic infrastructure

 → got internal approval to create Azure Databricks
 Workspaces, User Groups, Azure DevOps pipelines (for CICD).

+

A Walkthrough MLOps Demonstration Set up your first Databricks MLOps Platform on Day 1

 The Solution
 A production-ready MLOps platform accelerator that leverages Databricks and Unity Catalogs

 Mantel group
 (1) Create DEV/UAT/PROD Workspaces, Unity Catalogs & User Groups to support key Personas

 X
 (2) Deploy end-to-end ML pipeline with automated CICD

databricks

Admin, Data Engineer, Data Scientists & ML Engineer, Deployer, Analysts

Feature engineering, Model training & deployment, Inferences

= Enable production-ready ML use case development from Day 1 onwards

21

Live Demo

Kickstart future-proof MLOps

Start with a comprehensive blueprint. Then Iterate fast.

- → Fast iteration for each of your ML use cases.
- → Standardised DataOps & DevOps patterns.
- → Infrastructure-as-code that is auditable, repeatable, and customisable.

Key Takeaways

Scaling Al in your organisation

Practical insights we observed in the field, with Databricks offerings as enablers

Bring every Al service and initiative into a modern MLOps platform

Apply the same governance & PoC-toproduction workflows.

Eliminate duplicate efforts.

Leverage scalable, automated pipelines.

How Databricks can help

- →MLOps Stack templates, to set up Databricks Workflows and automatic CI/CD
- →Central feature stores and model registry boosted by Unity Catalog

Integrate with existing processes and systems in a continuous, agile way

Start with minimal impact to end-user experiences.

Establish 'intermediary' tools to connect to legacy systems.

Iterate instead of waiting for big system migration.

How Databricks can help

- →Unity Catalog with external locations
- →Federated querying and ML training
- →Delta Sharing of data and models

Share Al knowledge and best practices to technical and non-technical teams

Upskill ML teams with training programs and integrated delivery.

Engage business stakeholders from roadmapping onwards.

Enable non-technical end users to use Al and to build understanding.

How Databricks can help

→Databricks Academy & ILT customer training
 →Databricks Lakehouse Center of Excellence
 →Data Intelligence Platform

Changing how the world works for the better.
